# DON'T LEAVE DRY FOOD DRY

## **Your Pet's Body Is 60% Water**

Dogs and cats are designed to eat carcasses and other fresh food, which contain a great deal of moisture, at least 70%. Compare this to packaged dry food which averages 8% moisture. So imagine what your pet has to make up for by drinking water! Digesting highly-processed, dry proteins puts a greater burden on their system, especially the kidneys.

## **Do Crackers Clean Your Teeth?**

Many people believe that dry food helps keep their pet's teeth clean. That is a myth. The truth is that chewing will help keep your pet's teeth and gums healthy, so offer raw bones or natural dried chews. Or, do regular brushing with pet toothpaste (it tastes good, and, most importantly, doesn't foam up) or enzymatic pet mouth spray. Daily chewing will also ensure that any residual food is cleaned from the mouth.

## **What Else Is Missing In Dry Food?**

To put it simply – life! Dry food doesn't have the enzymes that fresh food naturally contains. This forces the body to provide those missing enzymes itself, which can put stress on the system, especially the pancreas. Naturally occurring vitamins derived from food are always preferable to synthetic vitamins. Naturally derived nutrition is by design more balanced and usable by the body, and offers many trace elements that work together in the body.

## **The Bare Essentials**

We know it's convenient to feed plain dry food, but we urge you to add just a few things:

- Water: Number one, add moisture, at least in the form of good clean water poured over the food. You can also use diluted low-sodium broth or tomato juice, or products from our store like raw cultured goat milk or fermented fish broth
- Nutrition Optimizers: These two additions will do wonders to improve your pets' health.
  - Fish oil
  - A blended "green" supplement (see the list on the next page)
- Enzymes: Digestive enzymes are an important addition for animals that aren't eating any fresh food, who suffer from chronic illness, or are elderly.

supplements that  
contain enzymes

## Any Fresh Food You Add Is A Good Thing

You can add up to 25% additional fresh food to a dry diet without throwing off the balance too much. This could be fresh food from your own kitchen, or food purchased at Dexter's.

## Cautions for "People Food"

"Table scraps" can indeed be bad for our pets if they are the unhealthy parts like cooked fat, fat trimmings, cooked skin, or foods cooked for the human palate that are full of spices, creams, or processed ingredients. And because Xylitol is toxic to dogs never feed "sugar free" sweets and desserts.

## The key is adding a variety of *healthy, natural* fresh food:

- Raw, boiled, or scrambled eggs
- Raw or cooked lean meat (no deep fried stuff!)
- Tinned whole sardines (in water, no salt or flavoring, ex: Trader Joe's brand)
- Yogurt, Kefir, or cottage cheese
- Raw, cultured milk (Dexter's has this!)
- A few berries (hmmm, dessert!)
- Assorted green veggies (ground or grated is best if served raw).
- Dried Alfalfa & Kelp
- Sprouts
- Bone Broth

## Some foods at Dexter's that mix well with dry food:

- The Honest Kitchen
- Sojos
- Grandma Lucy's
- Bravo Homestyle (freeze-dried)
- Freeze-dried Smallbatch
- Freeze-dried Primal
- Halshan raw food (can be cooked)

## Common Fresh Foods You Should NOT add:

- Onions
- Large Amounts of Garlic (a clove a day for a medium-sized dog is fine)
- Macadamia Nuts
- Cooked Bones
- Raisins, Grapes
- Raw trout or salmon
